

JAKUB HOVORKA

DevOps Engineer | CNCF Golden Kubestronaut

@jhovorka@proton.me <https://www.linkedin.com/in/jakub-hovorka> Gothenburg jakubhovorka.cloud

SUMMARY

DevOps Engineer (4+ years) focused on Kubernetes, CI/CD automation, and cloud/hybrid infrastructure built with Infrastructure as Code. Former software engineer with strong understanding of developer workflows. Holds the CNCF Golden Kubestronaut title, earned by completing 16 certifications across the CNCF and Linux Foundation ecosystem.

EXPERIENCE

DevOps Engineer

LOGEX AB

06/2023 - Present Gothenburg, Sweden

Role Summary

- Managed and optimized Kubernetes workloads, CI/CD pipelines, and Helm charts while collaborating closely with development teams to troubleshoot production issues.
- Maintained Azure infrastructure with Terraform and operated observability and logging systems (Prometheus, Thanos, Grafana, ELK, Loki).
- Onboarded, configured, and maintained developer and data engineering tooling with SSO integration, scalable deployments, and lifecycle management.
- Supported, extended, and integrated data-platform tooling for Project Nightingale with internal applications, including Argo Workflows, Spark, Trino, Nessie, and JupyterHub.

Key Achievements

- Unified and standardized all deployment Helm charts across the organization, improving maintainability, consistency, and onboarding speed for engineering teams.
- Led the organization-wide migration from Bitbucket Pipelines to ArgoCD for all application deployments, then optimized and stabilized the platform to reliably deploy 140+ applications across 25 clusters. Educated teams on GitOps workflows and best practices during the transition.
- Revitalized and optimized the observability stack (Prometheus, Thanos, Grafana), and modernized the logging platform (ELK Stack), including a full migration to a new environment.
- Took ownership of the infrastructure and DevOps track within Project Nightingale, integrating data platform components (Argo Workflows/Events, Spark, Trino, Nessie, RabbitMQ, MinIO, DataHub, JupyterHub). Designed event-driven workflows, developed custom Python tooling for Spark-on-Kubernetes standardization, and optimized resources while collaborating with stakeholders to deliver scalable solutions.
- Led the migration from Ingress NGINX to Envoy Gateway as part of the organization-wide transition to Gateway API, improving reliability, flexibility, and security of traffic management.

SKILLS

Kubernetes

AKS, GKE, K3s, Talos

Infrastructure

Azure, Google Cloud, Proxmox

Networking & Security

Cilium, Kyverno, Envoy Gateway, Ingress NGINX

CI/CD

ArgoCD, GitLab CI/CD, Bitbucket Pipelines, Helm

Logs & Metrics

Prometheus, Grafana, Thanos, Loki, Alloy, Elasticsearch, Kibana, Tempo

Infrastructure as Code

Terraform, Ansible

Core technologies

Linux, Docker, Git

Scripting

Bash, Go, Python

Storage

MinIO, PostgreSQL

Data Platform & Orchestration Infrastructure

Spark, Argo Workflows, Argo Events

AI

kagent, kmcp, LiteLLM

CERTIFICATIONS

CNCF Golden Kubestronaut

The highest level of recognition awarded by the Cloud Native Computing Foundation (CNCF), earned by completing all 16 CNCF and Linux Foundation certifications across the Kubernetes and cloud-native ecosystem.

EXPERIENCE

DevOps Engineer

CGI

12/2022 - 06/2023 Prague, Czech Republic

Role Summary

- Managed and supported deployments of containerized banking and finance applications on Kubernetes using GitLab CI/CD, Helm, and ArgoCD.
- Collaborated with developers to resolve application issues, perform version upgrades, and improve deployment workflows.
- Worked across Docker, Kubernetes, Git, Bash scripting, SQL databases, Rancher, and Linux-based virtual machines, frequently leveraging Azure cloud services.
- Educated development teams on DevOps tooling and best practices.

Key Achievements

- Streamlined Kubernetes deployment workflows across multiple client projects, improving release consistency and reducing deployment time.
- Improved reliability of GitLab CI/CD pipelines by troubleshooting build issues and optimizing pipeline stages.
- Enhanced developer productivity by introducing clearer deployment documentation and providing hands-on guidance in Helm, ArgoCD, and Kubernetes fundamentals.
- Supported the adoption of ArgoCD for selected projects, contributing to smoother GitOps-driven deployments.

Software Engineer

Perlogix

01/2022 - 12/2022 Virginia, United States (Remote)

Role Summary

- Worked as a full-stack developer on *Paradrop*, a cybersecurity asset management tool.
- Built backend services using Python Flask for REST APIs and database operations.
- Developed the frontend using vanilla JavaScript and Bootstrap.
- Containerized the application using Docker and managed deployments on DigitalOcean with GitHub Actions CI/CD.

Key Achievements

- Designed and implemented core backend functionality in Flask, improving data access reliability and API performance.
- Built and refined user-facing features using JavaScript/Bootstrap, contributing to a cleaner and more intuitive UI.
- Introduced containerization with Docker and established a stable GitHub Actions CI/CD pipeline, reducing deployment overhead and improving release consistency.
- Played a key role in delivering a fully functional, production-ready cybersecurity tool used by early customers.

EDUCATION

Information Technology

Information Technology High School Kladno

09/2014 - 06/2018

- Specialized IT curriculum including computer science theory, network protocols and configuration, operating systems, system administration, database fundamentals, and practical hardware assembly.

PROJECTS

Homelab Infrastructure & GitOps Platform

- Built enterprise-like Kubernetes homelab on Proxmox to develop and validate DevOps practices and tooling in a controlled environment.
- Automated infrastructure provisioning with Terraform (VMs, Talos/K3s clusters, applications) and Ansible (K3s setup, HAProxy configuration).
- Implemented GitOps workflow using GitLab CI/CD and ArgoCD for automated cluster bootstrapping, CRD deployment, and application management.
- Deployed and maintained platform components including cert-manager, MetalLB, Envoy Gateway, Loki, Prometheus, Harbor, Authentik, and MinIO.
- Built custom Docker images through reusable CI pipelines to containerize applications.
- Serves as hands-on learning and testing environment for new technologies and architectural patterns.
- Can present and demonstrate majority of skills and technologies from CV using this homelab.
